

Using the conservative exposure assumptions described above, EPA has concluded that the TMRC from use of imidacloprid from published uses is 0.008358 mg/kg/bwt/day utilizing 14.7 percent of the RfD for the general population. For the most highly exposed subgroup in the population, non-nursing infants (<1 year old), the TMRC for the published tolerances is 0.01547 mg/kg/day. This is equal to 27.1 percent of the RfD. Therefore, Bayer concludes that dietary exposure from the existing uses including the currently proposed tolerances will not exceed the reference dose for any subpopulation (including infants and children).

E. Other Considerations

There is no reasonable expectation that secondary residues will occur in milk and eggs, or meat, fat, and meat byproducts of livestock or poultry; there are no livestock feed items associated with the cucurbit vegetables.

F. International Tolerances

No CODEX Maximum Residue Levels (MRL's) have been established for residues of Imidacloprid on any crops at this time.
